

Nested Refinements — Meeting Notes

Date: June 3, 2026 | Project: Search & Navigation

Meeting Summary

The team aligned on the strategy for implementing nested refinements using **conditional refinements as the foundation**. Previous attempts with Drew using 'wet logic' for parent headers were abandoned. After consulting with Shlomo and Sam Herman, the team confirmed conditional refinements are the correct and feasible approach.

How It Works

- A **conditional refinement** (e.g., "Display Resolution") serves as the parent.
- Rule criteria values (e.g., 4K, 8K) become the **parent headers** visible on the site.
- The **spec refinement values** (e.g., native resolution values) nest as children under those headers.
- Once nested, the spec refinement does **not** show independently — only in the nested position.
- **One spec refinement rule:** if a conditional rule contains more than one source refinement, it is ineligible for nesting.

Key Design Decisions

- **Refinement-based, not category-based** — Nesting flag lives on the conditional refinement, not individual categories.
- **No redundant display** — If a value is nested, it shows only nested — never twice.
- **Parents with one child** — Show the parent with a chevron/caret; child text displays on expansion. Parent text is always used.
- **Orphan values** — Everything must have a parent. Co-mingling of parents with and without children is acceptable per UX.
- **UX simplification framing** — Three paths: (1) Slider (purely numeric), (2) Conditional/Nested, (3) Simplified conditional without nesting.
- **Threshold-based logic preferred** — Preferred over manual checkboxes since category content changes over time.

Validation & Restrictions

When a user flags a refinement as nested, the system must validate that **all associated rules have only one source refinement**. If any rule has two or more source refinements, nesting must be blocked or flagged with an alert.

This validation applies in two directions:

1. When **flagging** a refinement as nested — validate existing rules.
2. When **creating a new rule** on an already-flagged nested refinement — validate the new rule doesn't violate the single-source requirement.

Timeline

Milestone	Target
BHiA (DS/dev work)	July (stretch) / August (committed)
BHJ (operationalizing)	August
Nested refinements live on site	August
BHiA dependent on drawer ticket	BHiA July → BHJ August/September

Next Steps

- [] **Keith** — Draft detailed requirements for BHiA ticket #9227; share with group before submitting.
- [] **Requirements Review Meeting** — Smaller group: Keith, DS dev rep, Aaron. Review requirements before submission to avoid kickbacks.
- [] **DS Team** — Determine data model — flag field on conditional refinement or separate table. Add nested indicator at refinement level.
- [] **DS Team** — Build validation logic: block or alert when a nested-flagged refinement has a rule with more than one source refinement.
- [] **Keith / Team** — Continue auditing refinements with 30+ values and active item codes; provide candidate count to leadership.
- [] **Flag Placement** — Confirm trigger/flag lives on the conditional (parent) refinement detail page — not category page, not spec refinement.
- [] **Reporting (Tomorrow AM)** — Report out to Nat: August target for live nested refinements, July stretch; strategy is conditional refinement-based.
- [] **Related Ticket** — Review PAWC-7837 (DS flagging feature) for potential reuse — note it lacks required validation restrictions.
- [] **UX Clarification** — Confirm UX designs account for the conditional refinement approach (current UX not specifically designed for this).
- [] **Open Question** — Confirm behavior when customer selects a parent header: do all children auto-select and expand? Keith to check UX docs.
